```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
This the DNA sequence of the dspE gene of Pseudomonas syringae pv. tomato DC3000 that codes for a 42.9 kDa hypersensitive response celicitor (HRE) polypeptide (see AAW97851), termed HrpW. To identify any HRE-like genes in the P. syringae pv. tomato DS300 DNA flanking hrpR, cosmid pCPP2357, which contains this region in vector pCPP47, was isolated. A series of subclones in pML123 were constructed and corrected for 2 potential HR phenotypes: (1) the ability to promote tobacco HRE activity in Pseudomonas fluorescens cells carrying pCPP2774, a delhrp2 pHTT11 derivative, and (ii) interference with the content of P. fluorescens cells carrying wild-type pHIR11. CC pCPP2774, a delhrp2 pHTT11 derivative, and (ii) interference with the content of P. fluorescens cells carrying wild-type pHIR11. CC second. Transcriptional unit v of this subclone contained the created DNA molecule can be used to impart disease resistance to plants. This is achieved by applying the HRE protein in a con-infectious form to plants or plant seeds. Alternatively, cc transgenic plants or plant seeds transformed with DNA encoding the CC HRE can be provided.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New hypersensitive response eliciting (dspE) gene and protein useful for providing transgenic plants and seeds with enhanced growth, and insect and disease resistance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 1; Page 37-38; 56pp; English.

                                                                                                                                                                                                                                                                                                The patent discloses a method to impart stress resistance to plants applying a hypersensitive response elicitor in a non-infectious form a plant or seed. The present sequence is dspE gene encoding hypersensitive response elicitor protein from Pseudomonas syringae. The present sequence is used to transform transgenic plant or plant seeds to impart stress resistance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1681

Instead, the proteins impart disease resistance to plants, enhance plant growth, and/or control insects. The polypeptide fragments may be used to these properties to plants. The plants which may be treated in this way include vegetables, crops and ornamental plants such as alfalfa, rice, wheat, barley, rye, cotton, sunflower, peanut, corn, potato, sweet potato, bean, pea, chicory, lettuce, endive, cabbage, brussel sprout, beet, parsnip, turnip, cauliflower, broccoli, radish, spinach, onion, garlic, eggplant, pepper, celery, carrot, squash, pumpkin, zucchini, cucumber, apple, pear, melon, citrus, strawberry, grape, raspberry, pineapple, soybean, tobacco, tomato, sorghum or sugarcane, Arabidopsis thaliana, Saintpaulia, petunia, pelargonium, poinsettia, chrysanthemum, carnation or zinnia.

The hypersensitive response is rapid localised necrosis. The hrp protein and gene when used in nucleotide constructs are useful for providing disease resistance plants, insect control to plants, and enhancing plant growth (enhancing fruit size and earlier colouration and maturation), by direct application of the protein to plants, or by producing transgenic plants or seeds using the hrp gene.

KSM-P15. The pectic acid lyase has high pectic acid lyase activity which degrades pectin in plant cell walls and fibre in vegetables, and so is useful as a component of detergents, a food-processing agent, or a fibre-processing agent. The pectic acid lyase has a higher optimum reaction pH (10.3-10.7) than known Bacillus pectic acid lyases (pH 8-9.5) and so has wider industrial applications. Unlike present pectic acid lyases, the new enzyme has a high enzyme

                                                                                                                                                                                                                                                                                                                                                                                       This sequence represents a gene encoding a subunit of the cellulose synthase complex of Vigna angularis. The invention relates to subunits cellulose synthetic equipment, that can be used to increase the amount cellulose synthesised by a plant. The proteins and genes encoding them can also be used to improve the properties of the cellulose being
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A gene encoding a cellulose synthetic equipment - in the amount of cellulose synthesised in a plant % \left( 1\right) =\left\{ 1\right\} 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1511

                                                                                                                                                                                                                                                                                                                    The sequence is that of an example randomising oligonucleotide which is used in the prepn. of mRNA encoding candidate polypeptides for the method of systematic polypeptide evolution by reverse translation (SPERT). The method provides a rapid way of isolating and identifying polypeptide ligands which bind to target mols. The polypeptide ligands can be used in e.g. assay methods, diagnostic procedures, cell sorting, as activators or inhibitors of target mol. function, as probes, as sequestering agents, drug delivery vehicles, modififers of hormone action and as catalysts. See also AAQ21830-Q21832.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         QΥ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           밁
                        SPERT is used to select novel polypeptides that bind the antibody of the epitope commonly recognised by the antisera from autoimmune mice which are the fl progeny of a cross of NZB and NZW parents CC (Portanova et al., J. Immunol. 144, 4633, 1990). The known epitope CC consists of ca. 10 amino acids at the N-terminus of the histone H2B CC protein. To make mRNA encoding candidate polypeptides a 5' fixed sequence composed of a 77 promoter sequence and a ribosome binding CC site which is recognised by both prokaryotic and eukaryotic ribosomes, CC terminating in a restriction endonuclease site is synthesised and cloned CC using a number of oligonucleotides (example shown). A 3' fixed sequence is placed into a restriction site to provide an mRNA encoding the C-CC terminal trailer sequence of ca. 100 nucleotides lacking stop codons. CC In addition, a 3' primer annealing site is provided so that CDNA Synthesis can be accomplished on the mRNA recovered from partitioned CC ribosome complexes. See also AAQ36845-63.

                    The present sequence was used in an example illustrating an invention relating to a method for isolating a polypeptide ligand for a desired target molecule. The method involves synthesising a nucleic acid mixture comprising mRNA having translatable and non-translatable regions and a mixture of nucleic acid polypeptide copolymers, each comprising the mRNA having translatable copolymers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                     (PRIB/)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    partitioned relative to their affinity to the target. The method is termed systemic polypeptide evolution by reverse translation (SPERT). The polypeptides ligands of small molecule targets are useful in assay methods, diagnostic procedures, cell sorting, as inhibitors of target molecule function, as probes, as drug delivery vehicles and modifiers of hormone action and have therapeutic uses as sequestering agents. The target molecules include natural and synthetic polymers, including proteins, hormones, receptors and cell surfaces, nucleic acids and small molecules such as drugs, metabolites, cofactors and toxins. Polypeptide ligands are isolated and rapidly identified by this method.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1256

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 a protopectinase having an optimum pH 7 or higher against protopectin and polygalacturonic acid substrates. Inclusion of protopectinase gives a composition that provides better removal of muddy soil, particularly from socks. The present sequence encodes pectic acid lyase from Bacillus sp. strain KSM-P15, which is used in an example from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Detergent composition containing protopectinase active at alkaline pH\ \ - on protopectin and polygalacturonic acid, provides better removal of muddy soil
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Hatada Y,

                                                                                                                                                                                                                                                                        The present sequence is a DNA encoding pectate lyase I. It is a pectin degrading enzyme derived from Bacillus licheniformis, ATCC 14580. The enzyme comprises a catalytic active domain and a cellulose binding domain (CBD) that are operably linked to each other. It shows optimum activity at pH greater than 9 and temperature 55 degree centigrade. It can be used in detergent compositions, for cleaning hard surfaces, for machine treatment of fabrics, for improving the properties of cellulosic fibres, yarn, woven or non-woven fabric, for the degradation of plant material e.g. recycled waste paper, mechanical paper-making pulps or fibres subjected to retting process, for preparing animal feed and for processing wine or juice. DNA encoding the enzyme can also be used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Pectate lyase I; EC 4.2.2.2; pectin degrading enzyme; ATCC 14580; catalytic active domain; cellulose binding domain; CBD; operably linked; optimum activity; pH; detergent composition; yarn; cellulosic fibre; recycled waste paper; pulp; retting process; animal feed; wine; juice;

                                                                                                                                                                 Matches
                                                                                                                                                                                           Query Match
                                                                                                                                                                                                                                                         This sequence encodes an immunogenic portion of a soluble Mycobacterium tuberculosis (MT) antigen which can be used in a method for inducing protective immunity against tuberculosis (TB). This sequence can be formulated into vaccines and/or pharmaceutical compositions for immunising against M. tuberculosis infection or may be used for the diagnosis of tuberculosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           皮
                                                                                                                                                                                                                                                                                        New isolated Mycobacterium tuberculosis polypeptides and to develop products for the detection of M. tuberculosis and diagnosis of tuberculosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1151
                                       tuberculosis antigen, or an immunogenic portion of a M. tuberculosis antigen, as well as DNA sequences encoding such polypeptides, recombinant expression vectors and transformed or transfected host cells. Also claimed are methods and diagnostic kits for detecting M. tuberculosis infection in a patient using these polypeptides, antibodies or oligonucleotide probes and
                                                                                                                            sequences. The invention relates to methods and compositions diagnosing tuberculosis. It provides polypeptides (see AAW64291-W64379) comprising an antigenic portion of a soluble
                                                                                                                                                                         AAV44436. XP22 DNA was isolated from a M. tuberculosis strain genomic DNA expression library using sera from patients having extrapulmonary tuberculosis. It bears no similarity to known
                                                                                                                                                                                                                     This is the 3' region of DNA coding for an antigenic portion of Mycobacterium tuberculosis antigen XP22; 5' DNA is provided in
                                                                                                                                                                                                                                                               Claim 4; Page 186; 250pp; English.
